

Mechanical to Air-Powered Upgrade

Features and Benefits

- Increased Efficiency
- Reduced Energy Bill
- Huge Savings

Industry Group: Warehousing

"I highly recommend the CA leveler from McGuire. It's a much better alternative to a mechanical dock leveler that can save thousands of dollars in maintenance and parts over the lifetime of the leveler."
- President

McGuire CentraAir Leveler

Opportunity: A warehousing company was ready to replace mechanical dock levelers with push button operated levelers that do not rely on electricity in the pit.

Challenges: The president of the company researched the use of air bag or hydraulic levelers and discovered the added cost of installation. He wasn't keen on the expense of installing electrical power at the back of every single pit, especially since his staff was planning to install the levelers themselves and not hire additional subcontractors.

The Solution: McGuire installed the CentraAir Leveler which operates with compressed air, either from existing plant air or with a dedicated compressor. The install team was able to successfully install the levelers and only run electricity to the compressor. The company now has flawless service in the CA with significantly less maintenance and replacement parts needed over the life of the levelers.
