

In recent years, J.D. Neuhaus has continuously expanded its custom design and project business and, in conjunction with this, has opened up new areas of application and accessed new customers.

For example, more and more individual and customized complete solutions for moving loads are supplied in addition to standard products. Crane system planning and construction has become an important and ever increasing aspect of our product and service portfolio.

The second substantial change is a significant increase in hydraulic drives for our crane systems and hoists. The crane systems are used mainly on offshore installations. The hoists are ideally suited for subsea applications and BOP handling in arctic zones at temperatures down to -45° Celsius as well as on landrigrs.

By these means, J.D. Neuhaus increasingly develops competencies and market opportunities in sectors with particularly harsh operating conditions. Under such conditions, the high degree of reliability and long service life of our products pays off.

These two distinctive developments within the company and with regard to products and markets are expressed worldwide in our marketing communication and in the corporate design of J.D. Neuhaus by evolution of the logo and the new claim.

We are looking forward to be of service to you.  
Feel free to contact us for all your lifting needs.

With my best regards,

Frank W. Endler
