USER’S GUIDE FOR INSPECTION OF DAMAGED STORAGE RACK SYSTEMS

DON’T WAIT UNTIL IT’S TOO LATE!
The purpose of this document is to provide owners/operators a simple, educational pictorial resource to aid in their timely identification of the most common types of pallet rack damage.

Mac Rak, Inc. assumes no responsibility or liability of any kind as a result of the use of this guide. All users of this guide agree to defend, protect, indemnify and hold Mac Rak, Inc., their employees, and their distributors harmless for any claims or losses.
Warehouse Pallet Rack Systems are engineered, high performance structures that are designed to support product loads many times their weight. Each pallet rack component is designed, manufactured, and tested against rigorous quality controls. These standards ensure that the rack system will safely perform with designed load applications corresponding to specific configurations.

Although the Rack Manufacturer’s Institute (RMI) design specifications include safety factors, these calculations do not consider additional requirements that are imposed as a result of post-manufacture damage. Therefore, it is critical that pallet racks be routinely inspected and maintained correctly so they can continue to perform as originally designed.

Component damage reduces the pallet rack’s carrying capacity and may ultimately lead to a catastrophic pallet rack collapse. The total cost of a rack collapse is staggering and typically far exceeds the value of the entire rack structure and stored product. Even worse, a collapse often times leads to:

- Serious injury or death
- Higher insurance premiums, fines and legal expenses
- Product, equipment and business loss
- Expensive cleanup and replacement costs

This document is by no means intended to replace regular pallet rack system evaluations performed by qualified, trained professionals. This document specifically does not provide any engineering or legal opinion on this subject matter.

Modifications to pallet rack systems located in geographical areas that are in danger of seismic activity need to be reviewed by a qualified professional engineer.
Component deflection standards contained in this document pertain to all storage rack systems including Push Back, Pallet Flow, Carton Flow and Drive-In.
Pallet Rack safety is becoming increasingly scrutinized by OSHA, Federal and State agencies and insurance companies, and comes with substantial legal and moral liabilities. ANSI MH 16.1 – 2012 the industry standard for industrial pallet rack has recently been incorporated into the more general International Building Code. The I.B.C. includes the requirements and governs the construction of all warehouses in the United States. I.B.C. standards must be met in order to obtain local municipal building permit approval prior to construction and upon final completion. Therefore ANSI MH 16.1 – 2012 requirements are now subject to the same enforcement requirements as the I.B.C.

EXCERPTS FROM ANSI MH 16.1 – 2012

1. The storage rack system operator is responsible for maintenance and repair of storage systems.

2. Upon visible damage, the pertinent portions of the rack shall be unloaded immediately and removed from service by the user until the damaged portion is repaired or replaced.

3. Adjusting beam elevations or operating beyond approved work load limits on pallet rack frames and or support beams without regard to published manufacturers load tables is not allowed and will lead to rack failure.

4. Altering / modifying components without the direction of a proper supervisory engineer is not allowed and will lead to rack failure.

5. Proper aisle width and bay width must be maintained based on storage requirements.

OSHA General Duty Clause - Section 5 (a) (1)

- Employers are required to provide their employees with a place of employment that is “free from recognizable hazards that are causing or likely to cause death or serious harm to employees.”

Far too often, damaged rack remains in operation because it is ignored or mistakenly assumed to be safe. The reality is that many damaged systems are at the critical “TIPPING POINT” where just one more damaged component, or just one more seemingly non-significant impact will push the system into collapse. While no official standards have been adopted in the United States regarding rack damage, we are referencing the SEMA standards that are enforced throughout Canada and Europe.

DAMAGED RACK IS UNSAFE, DANGEROUS AND UNACCEPTABLE.

It is imperative that management create an environment with operators that ensures timely reports and immediate remedial action.

Owners/Operators should inspect their pallet rack systems on a regular basis. Particular attention should focus on damaged or missing rack system components listed on the following pages.
A. SEVERE COLUMN DAMAGE

- Damage under beam level
- Damage above beam level
- Damage behind beam connector
- Ripped column
- Outrigger damage
- Closed tube damage
- Structural column damage
- Structural column damage
- Structural column damage
Helpful Hint:
Inspect both front and back leg columns. Inspect for possible deformation BEHIND beam connectors as pictured on page 6, upper right hand corner.

Reference Standard:
Columns with rips, tears or deflection greater than ½" in either the down aisle or front to back direction must be repaired.

Corner column damage is more critical than damage to the front and sides of columns.

Rack damage to free standing single rows is more dangerous than the same damage on back to back rows with row spacers.
B. HORIZONTAL AND DIAGONAL STRUT DAMAGE

Helpful Hint:
The strut must be repaired if there welds are torn, broken or missing.

Reference Standard:
Missing horizontal or diagonal braces, or braces with any rips, tears or deflection in either plane beyond $\frac{1}{2}$" must be repaired.
C. FOOTPLATE DAMAGE

Sheered footplate  Sheered footplate  Sheered footplate

Reference Standard:
Front and back footplates which are torn, ripped or twisted past ½" require repair.

D. ANCHOR DAMAGE

Missing anchor  Loose anchor

Reference Standard:
Each footplate of the upright frame (front and back) must be anchored to the floor with a minimum of one anchor per footplate or per manufacturer’s requirements for that application. Check for missing, loose or sheared anchors.
E. BEAM DAMAGE, MISSING OR IMPROPER BEAM CONNECTORS

Helpful Hint:
Any beam with visible deformation or cracking of the beam end connectors must be unloaded and replaced. Be sure beams are fully engaged and installed with proper safety locks.

Reference Standard:
Load beams must be secured to withstand 1,000 lbs. of uplift force.

F. OVERLOADED BEAMS

Helpful Hint:
O.E.M. beam safety locks may be purchased and installed, or standard grade 5 bolts and nuts may be used if applicable. Be sure both the left and right sides are secure.

Reference Standard:
LENGTH OF BEAM = ALLOWABLE DEFLECTION
180

Example: 96" BEAM = .53" ALLOWABLE DEFLECTION
180

When the beam is loaded with product and bends down more than the allowable deflection, the beam must be replaced.

Helpful Hint:
Any beam with visible deformation or cracking of the beam end connectors must be unloaded and replaced. Be sure beams are fully engaged and installed with proper safety locks.
G. CAPACITY PLAQUES

Reference Standard:
Each manufacturer publishes frame capacity charts. Applicable information to your system must be prominently displayed on a placard at the end of an aisle.

![WARNING]

DO NOT CLIMB ON RACKS

Report all damage to management

Do not alter the structure without
- Evaluation by a Design Professional, and/or,
- Seeking approval from the Supplier

![CAUTION]

Conduct regular inspections to check for:
- Proper application and use
- Loads within allowable limits
- Damaged/disengaged structure or components

For questions contact:
ABC Rack Systems
123 Main Street
Anywhere, ST 01234
987-555-1234

LOADING DETAILS

All loads to be uniformly distributed.
For more info see load application and configuration drawings on file.

Average Pallet
2000 LBS
Maximum Pallet
2500 LBS

Average Pallet
2000 LBS
Maximum Pallet
2500 LBS

MAXIMUM SHELF LOAD 5000 LBS

25,000 LBS
Maximum Bay Load

Client: XYZ Warehouse
Project Reference: MacRak Sample
Date Supplied: 01/10/2014

Placard examples of acceptable format / content
Actual appearance may vary

**Helpful Hint:**
Be sure capacity plaques include beam elevations and design loads.

**WARNING**

DO NOT CHANGE ORIGINAL CONFIGURATION OR WEIGHT LOAD WITHOUT ENGINEERING APPROVAL. CHANGES TO THE ORIGINAL CONFIGURATION CAN CAUSE OVERLOADED FRAMES.

Plaques need to be changed whenever there are modifications to the rack configuration or load.
H. FRAME TO BE PLUMB/ FRAME TO BE STRAIGHT

Reference Standard:
**Out-of-Plumb/Out-of-Straight Ratio** – ½” in 10'-0” as measured by the maximum horizontal distance from the edge of the column at the top of the frame to a plumb line that extends downward to the floor (as illustrated). Columns exceeding this limit should be offloaded and replumbed, repaired or replaced.

Examples of Out-of-Plumb

When frames are out of plumb, the designed load capacity of the system is reduced. Any damage to a column that changes the original design shape would cause a reduction in the designed load capacity of the frame. This could also be considered out of straight based on the amount of defection.

DAMAGED PARTS MUST BE REPAIRED.
I. IMPROPER FRAME SPLICE

Reference Standard:
Although splices are an accepted practice, extreme care must be exercised to ensure they are approved by the various frame manufacturers, and are within their installation and performance limits.

CRITICAL:
All modifications to frames, including frame splices, must have engineering approval per application.

J. MISSING / INSUFFICIENT ROW SPACERS

Reference Standard:
Back to Back frames may need row spacers positioned a maximum of 10'-0" apart from each other. Consult a qualified engineer.
K. BROKEN / TORN COMPONENTS

Reference Standard:
Any component with broken or torn welds must be repaired.

L. DANGEROUS REPAIRS

Reference Standard:
Rack repairs must be approved by a supervisory rack engineer.
PROPERLY ENGINEERED RACK REPAIR SOLUTIONS

Reinforced Column Kit
Reinforced Column Kit with Outrigger Deflector
Single Leg Frame Kit
Double Leg Frame Kit

PROPERLY ENGINEERED RACK PROTECTION PRODUCTS

Outrigger Protection
Bolt-on Column Protector
Heavy-Duty Impact Protection
End of Row Guard

IMPORTANT FINAL WORD:
When choosing a pallet rack repair vendor be sure that their products and installation procedures have been reviewed and approved by a qualified supervisory engineer. Repair solutions and installation procedures that do not conform to accepted industry standards may often be as dangerous as the damaged rack component.
Mac Rak Inc. repair kits are engineered to the highest standards.
Mac Rak Inc. produces the highest quality, maximum future impact protection products available. Mac Rak Inc. offers a Limited Lifetime Warranty for all our products against defects in manufacturing and material workmanship. The Advantage, Elite and Bulldog product lines carry a Limited Lifetime Impact Warranty.
Our repair and protection products are powder coat painted. All necessary hardware and anchors are included. Mac Rak repair products may be installed without complete unloading of the rack when a rack-lifting jack is used.

Mac Rak repairs all types of storage racks.

For more information, contact your local dealer, or contact Mac Rak directly.
