Plate chain conveyor

MANGO

Complex tasks become easy

Mango understands what fashion is. At its main headquarters in Barcelona this clothing company has installed the deniway plate chain conveyor over a total length of 110 metres.

deniway is based on rollers and is – deceptively simply – designed as a module system: three standard components cover the basic requirements. This makes the design flexible. Height differences, challenging routes, large unit goods: this is what makes deniway complete. The energy consumption is reduced, as are CO₂ emissions; and maintenance and operating costs are decreased. Productivity is the only aspect that increases – and by a huge factor if experience is anything to go by.

The deniway plate chain conveyor

- simple, robust, reliable
- based on rollers, is therefore low on friction
- minimal wear and tear
- reduced energy consumption
- long conveying distance (up to 300 m) possible with just one drive
- also suitable for large unit goods
- allows very fast speeds
